

XP Core Values

Two XP core values that our team followed throughout the process of our project were respect and feedback. While all core values are important, we felt these values were best highlighted with our team collaboration.

We showed respect when collaborating on issues, providing feedback, schedules of team members, and building the project together. An aspect of this comes in defining roles and responsibilities from our initial sprint and onwards. We allowed for collaboration on requirements while maintaining boundaries to prevent overriding other team member's work or working on duplicate features. We also supported each other in any blockers that came up, in respect of each other's schedules throughout the semester. Team members were respectful of each other's schedules and stepped up to accept work, which helped further progress throughout the project. Any design and code issues were brought up to the team, and team members were ready to respond quickly.

Our team practiced feedback in reviewing team members ideas and commits, along with the continuous process of identifying any gaps in our application. In the early stages of the project, we worked together to create our feature set and requirements, which we broke down with the help of each other's comments and suggestions. Throughout the development of our application, completed features were communicated to teammates, who provided feedback in the form of fixes, modifications, or missing pieces. To prepare for our demo, members also provided feedback on touch ups and modifications to be made before the presentation day.
